Cancer Immunotherapy: Chapter 2. Components of the Immune System Amanda Norvell

The human immune system is arguably the most complex system in the human body. It is comprised of dozens of completely distinct cell types, each with its own set of signaling molecules, antigen-recognition mechanisms and effector functions. This complexity allows the immune system to respond to the potentially millions of distinct foreign antigens that it might encounter, from bacteria, viruses and other microscopic pathogens, to the body's own cells when they go awry in diseases such as cancer. This chapter provides an overview of the central cellular architecture of the immune system and describes the ways in which its cells are regulated during the immune response. We are now entering an era in which we have a sufficiently deep understanding of these fundamental regulatory mechanisms that they can be harnessed to provide a highly selective therapeutic strategy for targeting cancer cells.
